Anti-PTAM antibodies may be used as antagonists, as a targeting or delivery mechanism for bringing pharmaceutical agents into cells or tissues expressing PTAM and for diagnosis of PTAM-related disorders. PTAM, its catalytic or immunogenic fragments are useful for drug screening using libraries of compounds. PTAM polynucleotides are useful itor generating hybridisation probes useful in mapping the
                                                                                                                                                                              New human protein transport-associated polypeptide and polynucleotide useful for diagnosis, prevention and treatment of cell proliferative and secretory disorders such as leukemia, cystic fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAA08035 to AAA08042 encode the human protein transport-associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      naturally occurring genomic sequences

Human secreted protein encoded from gene 4.

Secreted protein; prevention; treatment; protein therapy; gene therapy; diagnosis; cancer; tumour; neurodegenerative disorder; blood disorder; developmental abnormality; fetal deficiency; leukemia; autoimmune; acne; hepatic disease; renal disease; lymphoma; inflammation; allergy; achima; Alzheimer's disease; cognitive disorder; schizophrenia; obesity; sepsis; osteoporosis; arthritis; infection; AIDS; connective tissue disorder; transplant rejection; diabetes; psorlasis; cardiovascular disorder; reproductive disorder; food addiliue; food preservative; human; primer; early promoter; GAS; gamma activation element

```
This invention describes novel isolated human genes and the secreted proteins they encode. The polynucleotides and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions eg. by protein for preventing, the properties and asample or by determining the presence of mutations in polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for the polynucleotides of the invention based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and fetal deficiencies, blood disorders, leukemias, diseases of the immune system, autoimmune diseases, hepatic and renal disease, lymphomas, inflammation, allergies, Alzheimer's and cognitive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             asthma, sepsis, acne, psoriasis, cardiovascular disorders, and reproductive disorders. The polypeptides or polynucleotides can also be used as food additives or preservatives: The polypeptide are also useful for identifying their binding partners. This sequence represents a secreted protein described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     disorders, schizophrenia, obesity, osteoporosis, arthritis, infections, AIDS, connective tissue disorders, transplant rejection, diabetes,
                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated human genes potentially useful for, e.g. developmental abnormalities and fetal deficiencies
                                                                                                                                                                                                                                                                                                           Rosen CA, Ruben SM;

polypeptides
                                                                                                                                                                                                                                                                                      The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation
New secreted and transmembrane polypeptides and their polynucleotides, useful for treating blood coagulation disorders, cancers and cellular adhesion disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DGNQVVRDKITELRVQ------136

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The specification describes A33 related antigens PRO301, PRO362 and PRO245. The methods and compositions of the invention are useful for the treatment and diagnosis of inflammatory disease and tumours in mammals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 seases allergic diseases of the lung such as eosinophilic pneumonias, sopathic pulmonary fibrosis and hypersensitivity pneumonitis

```
sequence tag) sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bloactive molecules to cells and for modulating biological activities of cells, using the polypeptides for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide pairs provide specific targeting of bloactive molecules to cells. AAC788600 to AAC7887 represent PCR primers and probes used in the isolation of the PRO polynucleotide sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      tumourigenesis; defection; neoplastic cell growth; proliferation; cytostatic; antiinflammatory; immunomodulatory; inflammatory disorder;

inflammatory disorders and immunological disorders can be treated.
AAC58123 to AAC58224 represent hybridisation probes and PCR primers used in the isolation of the human PRO sequences. AAC58225 to AAC58241 and AAB24054 to AAB24056 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes an isolated antibody (Ab) that binds to one of the human proteins (P) designated PR0213, PR01330, PR01449, PR0237, PR03124, PR0352, PR03644, PR05131, PR03139, PR03130, PR03130, PR03130, PR03130, PR03130, PR03130, PR03130, PR03130, PR03130, PR03132, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, PR03131, P

proteins, anti-TRO antibodies, agonists and antagonists are useful for treating and diagonisting immune related diseases. The human PRO proteins, anti-TRO antibodies, agonists and antagonists are useful for treating and diagonisting immune related disorders. The disorders are selected from systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathes, systemic scalerosis, diopathic inflammatory myopathies, 5) ogren's systemic vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases, inflammatory bowel disease, gluten-sensitive enteropathy and whipple's disease, autoimmune or immune-mediated skin diseases, allergic diseases, inflammatory contimunue or immune-mediated skin diseases, allergic diseases.

Immunological diseases of the lung and transplantation associated diseases including graft rejection and graft-versus-host-disease.

AAC58397 to AAC58578 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AAC58579 to AAC58678 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention.
                                                                                           Sixty four PRO polypeptides, useful in the diagnosis and treatment of immune related disorders, e.g. systemic lupus erythematosis, rheumatoid arthritis, osteoarthritis, thyroiditis and diabetes mellitus
                                                                                                                                                                                                                                                           The present invention describes sixty four human PRO proteins which can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DGNOVVRDKITELRVOKLSVSKPTVTTGSGYGFTVPQGMRISLQCQARGSPPISYIWYKQ 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is that of human antitumour protein PR0362, as deduced from a foetal brain cDNA clone (see AAA49725). PR0362 has a mol.wt. of 35,544 and a piof 8.51. It has homology to A33 antigen protein and to the HCAR protein as well as to Dayoff sequences. A claimed method for inhibiting the growth of a tumour cell comprises exposing the tumor cell to PR0739, PR0320, PR0312, PR0321, PR0324, PR0312, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0313, PR0

The proteins can also be used as biomarkers to identify tissues or cell types, which express the proteins. The polynucleotide molecules can be used as biomarkers for tissues or chromosomes and to elicit immune responses. The proteins and antibodies are useful in diagnosis and treatment of diseases associated with altered expression of these proteins. The proteins are also useful for prevention or treatment of platelet disorders, stem cell disorders, osteoporosis or osteoarthritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ostecarthritis; burn; incision; stem cell disorder; osteoporosis; osteoarthritis; burn; incision; ulcer; periodontal disease; neuropathy; nervous system disease; bone growth; cosmetic plastic surgery; gut protection; gut regeneration; fibrosis; cancer; bone marrow transplantation.

ä.
                                  the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide encoded by a full length human cDNA of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; secreted protein; proliferative disorder; cancer; tumour; foetal abnormality; haematopoietic disorder; foetal abnormality; haematopoietic disorder; immune system disorder; Alzs, autoimmune disease; rheumatoid arthritis; inflammation, allergy; neurological disorder; Alzheimer's disease; Parkinson's disease; cognitive disorder; schizophrenia, asthma; skin disorder; psoriasis; sepsis; diabetes; atherosclerosis; cardiovascular disorder; anglogenic disorder; kidney disorder; agastrointestinal disorder; prefated disorder; gene therapy; endocrine disorder; infection; wound healing; vulnerary; cell culture; chemotaxis; food additive; chromosome X;

30-JUN-2000; 2000US-0215136; (HUMA-) HUMAN GENOME SCI INC Baker KP, Young PE; Ruben SM, Komatsoulls GA,

WPI; 2001-343793/36. N-PSDB; AAD08498:

Isolated nucleic acid molecule encoding a human secreted protein is used in preventing, treating or ameliorating a medical condition

Claim 11; Page 440-441; 509pp; English.

AAD08488-AAD08529 represent cDNAs corresponding to 18 human secreted

protein genes, and AAE04199-AAE04239 represent the proteins they encode.

AAE0440-AAE04297 represent human secreted protein fragments or variants.

The secreted proteins and their genes are useful for preventing, the secreted proteins and their genes are useful for preventing, the secreted protein in a sample or by determining the presence of amount of the new protein in a sample or by determining the presence of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the sample or the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, hemantopoletic disorders, diseases of the immune system, albeit and adsentable and adseases of e.g., rheumatold arthritis, inflammation, allergies, neurological disorders (e.g., Alzheimer's disease, parkinson's disease, cognitive disorders, schizophrenia, asthma, skin disorders, and infections. The proteins and also be used to aid wound health and and epithelial cell proliferation, to prevent skin againg due to sunburn, to maintain organs before transplantation, for supporting coll cognate ligands or binding partners, and in chemotaxis, and can be used to a for a preservative to modify storage properties. Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoasays e.g., radioimmunoasay or enzyme linked immunoascabent assay (Elisa). The present sequence represents a human secreted protein of the invention.

÷. Isolated nucleic acid molecule encoding a human secreted protein used in preventing, treating or ameliorating a medical condition

Claim 11; Page 460-461; 509pp; English.

AAD08488-AAD08529 represent cDNAs corresponding to 18 human secreted protein genes, and AAE04199-AAE04239 represent the proteins they encode. AAE04240-AAE04297 represent human secreted protein fragments or variants gastrointestinal disorders, pregnancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent skin ageing due to sumburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their mutations in the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 18 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, AIDS, autolimune diseases (e.g., rheumatoid arthritis), inflammation, alleggies, neurological disorders (e.g., Alzheimer's disease, barkinson's disease, cognitive disorders, schizophrenia, asthma, skin disorders (e.g., psoriatis), sepsis, diabetes, atherosclerosis, cardiovascular disorders, anglogenic disorders, kidney disorders, chemotaxis, and can be used The secreted proteins and their genes are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the as a food additive or preservative to modify storage properties cognate ligands or binding partners,

Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, a in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (Elish). The present sequence represents a human secreted protein of the invention.

The present invention relates to albumin fusion proteins comprising a therapeutic protein X and human albumin (HA, also known as human serum albumin, HSA). The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in tro/in vivo activity. The protein is useful for treating and diagnosing disorders such as cancer, reproductive disorders disorders (e.g. acquired immundeficiency syndrome, AlbS), endocrine disorders (e.g. acquired immundeficiency syndrome, AlbS), endocrine disorders (e.g. Alzhehmer's, Parkinson's, Creutzfeldt-Jacob disease, encephalomyelmer's, Parkinson's, Creutzfeldt-Jacob disease, encephalomyelmitis, meningitis, schizophrenia), and connective disorders (e.g. osteoporosis, arthritis). AbBG65518 represent albumin tusion proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              121 DGNQVVRDKITELRVQKLSVSKPTVTTGSGYGFTVPQGMRISLQCQARGSPPISYIWYKQ 180

encephalomyelitis, meningitis, schizophrenia), and connective disorders (e.g. osteoporosis, arthritis). ABG63326-ABG65518 represent albumin fusion proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; secreted protein; proliferative disorder; cancer; tumour; foetal abnormality; heamstopoletic disorder; immune system disorder; AIDS; autoimmune disease; rheumatoid arthritis; inflammation; allergy; neurological disorder; Alzheimer's disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to albumin (HA, also known as human serum therapeutic protein X and human albumin (HA, also known as human serum albumin, HSA). The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and diagnosing disorders such as cancer, reproductive disorders, disease, ulcerative colliss, immune disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | ||||||||

AbD08488-AbD08529 represent cDNAs corresponding to 18 human secreted protein genes, and AAB04199-AAB04239 represent the proteins they encode. AAB04240-AAB04297 represent human secreted proteins and their genes are useful for preventing. The secreted proteins and their genes are useful for preventing. The secreted protein is an encode. The secreted protein is an encode containing the mount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 18 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental aborders, hemantopoletic disorders, diseases of the immune system, allos, neurological disorders, diseases of the immune system, allos, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, allergies, neurological disorders, disorders, schizophrenia, asthma, and disorders, and infections. The proteins of iseases of disorders, and infections. The proteins can also be used to aid wound health and epithelial cell proliferation, to prevent skin ageing due to subburn, to maintain organs before transplantation, for supporting culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used to and which health and epithelial cell proliferation, to prevent skin ageing due to connate ligands or binding partners, and in chemotaxis, and each of the impartners of the impartners of the impartners of the impartners of the impartners of the impartners of the impartners of the impartners of the impartners of the impartners of the impartners of the impartners of the impartners of the impartners of the impartners of the impartners of the impartners of the impartners of the impartners of the impartners of the impartners of the impartners of the impartners of the impartners of the impartners of the impartners of the impartners
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human secreted protein fragment referred to in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               136

Proteoglycan aggregate.";
J. Blol. Chem. 261:3319-3535(1986).
I- FUNCTION: STABILIZE THE AGGREGATES OF PROTEOGLYCAN MONOMERS WITH
HYALURONIC ACID IN THE EXTRACELLULAR CARTILAGE MATRIX.
I- ALTERNATIVE PRODUCTS: 2 ISOFORMS, A LONG FORM, GHOWN HERE) AND A
SHORT FORM; ARE PRODUCED BY ALTERNATYDE SPLICING.
I- SIMILARITY: CONTAINS 1 IMMUNOGLOBULIN-LIKE V-TYPE DOMAIN.
I- SIMILARITY: CONTAINS 2 LINK DOMAINS.

"Bowine chondrocyte link protein cDNA sequence: interspecies
conservation of primary structure and mRNA untranslated regions.";
comp. Biochem. Physiol. 112B:197-203(1995).

-I. FUNCTION: STABILIZE THE AGGREGATES OF PROTEOGLYCAN MONOMERS WITH
HYALURONIC ACID IN THE EXTRACELLICLAR CARTILAGE MATRIX.

-I. SIMILARITY: CONTAINS 1 IMMUNOGLOBULIN-LIKE V-TYPE DOMAIN.

-I. SIMILARITY: CONTAINS 2 LINK DOMAINS.

"Immunoglobulin fold and tandem repeat structures in proteoglycan N-terminal domatics and link protein.";
J. Mol. Biol. 206:737-753(1989).
-!- FUNCTION: STABILIZE THE AGGREGATES OF PROTEOGLYCAN MONOMERS WITH HYALURONIC ACID IN THE EXTRACELULAR CARTILAGE MATRIX.
-!- SIMILARITY: CONTAINS 1 IMMUNOGLOBULIN-LIKE V-TYPE DOMAIN.
-!- SIMILARITY: CONTAINS 2 LINK DOMAINS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 -I. SUBCELLUAR LOCATION: Secreted; extracellular matrix.
-i. SUBCELLUAR LOCATION: At least 4 isoforms; VO (shown here), VI, V2 and V3; are produced by alternative splicing.
-i. TISSUE SPECIFICITY: Cerebral white matter. VO and V1 are expressed in the central nervous system, and in a number of mesenchymal and epithelial itssues; the major isoform v2 is restricted to the central nervous system.
-i. DEVELOPMENTAL STAGE: Disappears after the cartilage development
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Biochim. Biophys. Acta 1075:248-258(1991).

-i- FUNCTION: May play a role in intercellular signaling and in connecting cells with the extracellular matrix. May take part in the regulation of cell motility, growth and differentiation. Binds hyaluronic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               the European Bioinformatics Institute. SUBUNIT: MAY FORM HOMODIMERS.
SUBCELLULAR LOCATION: Integral membrane protein.
TISSUE SPECIFICITY: FOUND EXCLUSIVELY IN THE CNS, WHERE IT IS
LOCALIZED ON THE SURFACE OF WYELIN AND OLIGODENDROCYTE CYTOPLASMIC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                66 WYRSPPSRVVHLYRNGKDQDAEQAPEYRGRTELLKESIGEGKVALRIQNVRFSDEGGYTC 125
